

I.Q. As A Percentage Of The Population.

I.Q. or Intelligence Quotient is the measure of HOW FAST we learn.

NOT a personality type. NOT the same as memory. NO difference between male and female.

Super soldiers pick up Ph.D.'s in spare time; if they were slow to learn they would not live past the first mission.

I.Q.

0-25 Idiot (actual psychological terms, not just slang words.)

25-50 Imbecile

50-70 Moron

70-90 low normal

90-110 normal - 100 actual mid-normal (50 % are slower, 50 % are faster)

110-150 Sub Genius. NOTICE BELOW:

* 130 In the 95th percentile. Only 5% of the population are quicker.

The Average I.Q. of all M.D.s and Ph.D.s

* 135 In the 99.02 percentile. Only .98 % are smarter.

Less than 1 percent total clear up to 190+

QUESTION: WHAT CAN a healthy person with an I.Q. of 135 do?

ANSWER: ANYTHING they want to!

150-190+ ? Genius to Super Genius

Note: The higher the I.Q. of a student the more he or she is MARGINALIZED (pushed aside, rejected) in a school by other students.

The gifted person is bored.

The others do not like him or her because “They think they are so smart!”

The Bell Curve or Normal Distribution
